

4541-1001 PNEUMATIC SERVICE PANEL

The **4541-1001 Pneumatic Service Panel** is designed to provide convenient connections for the Manometer's Output Pressure service to the various types of devices to be calibrated, tested, serviced, etc.

The Pneumatic Service Panel also provides an adjustable utility pressure supply, a utility vacuum supply, a means to vent the Manometer's Reference Vacuum Port to ambient pressure, or connect a known reference pressure. The Manometer's output pressure is available through four ports. Two of these output ports can be isolated through a valve, and two are connected directly to the Manometer output.
